

Well, I tried to send a well written & thought-out comment yesterday only to have it not be accepted by the system due to a time out error. Instead of attempting to do the same today, I'll be brief: Please DO NOT implement BPL! If you need to see why, the ARRL has prepared video filed that show quite plainly the trash that our nations airwaves would become from the harmful interference BPL generated during the test marketing sessions. This interference would not be limited to the U.S. but would spread far & wide, thereby eliminating the possibility of using any of the frequencies that BPL effects for radio communications. This includes any emergency communications for homeland security and health & welfare traffic that is currently handled free of charge by the large body of Amateur Radio Service operators in this country during those times of need. Please don't destroy the ability of LICENSED users of this spectrum by allowing BPL to become a reality; there's just too much at stake here to allow another commercial venture to jeopardize it all just to attempt to make a quick buck. The quality of existing broadband services is greater and is readily available to all who choose to take advantage of it without implementing BPL; therefore it appears to be an unnecessary offering simply being attempted to appease someone's political agenda. In summary, when it comes to BPL, JUST SAY NO! Thank you for your time & consideration.
